Codebraid: Live Code in Pandoc Markdown

Geoffrey M. Poore¹

Abstract-Codebraid executes code blocks and inline code in Pandoc Mark-Pandoc Markdown syntax. Pandoc handles all Markdown parsing and format code and output, while "jupyter_kernel" specifies a kernel. conversions. In the final output document produced by Pandoc, a code chunk can be replaced by a display of any combination of its original Markdown source. its code, the addout or adderr resulting from execution, or rich output in the case from sympy import + of Jugyter kernels. There is also support for programmatically copying code or $-init_printing()$ output to other parts of a document.

Index Terms-reproducibility, dynamic report generation, literate programming, Python, Pandoc, Project Jupyter

Introduction

Scientific and technical documents are increasingly written with software that allows a mixture of text and executable code, such as the Jupyter Notebook [KRKP'16], knitr [YX15], and Org- from sympy import mode Babel [SD11], [SDDD12]. Writing with such tools can init_printing() enhance reproducibility, simplify code documentation, and aid in automating reports.

This paper introduces Codebraid, which allows executable integral.doit() code within Pandoc Markdown documents [JG19], [JM19]. Codebraid is developed at https://github.com/gpoore/codebraid and is available from the Python Package Index (PyPI). It allows Markdown code blocks like the one below to be executed during the document build process. In this case, the ". ob. run" tells Codebraid to run the code and include the output.

'i.python .co.runi print("Bunning code within "Markdown!")

The final document contains the code's output, interpreted as if it the Jupyter Notebook. had been entered directly in the original Markdown source: Running code within Markdown!

A document using Codebraid can be converted from Mark-A simple Pandoc Markdown document that runs code with Codedown into any of the many formats supported by Pandoc, such as HTML, Microsoft Word, LaTeX, and PDF. Codebraid delegates all Markdown parsing and format conversions to Pandoc, so it does not introduce any special restrictions on what is possible with a var1 = "tello from "Python1." Pandoe Markdown document. This close integration with Pandoe also means that Codebraid can be extended in the future to work with additional document formats beyond Markdown.

Pandoc markdown font. Pandoc markdown font size. Pandoc font size.

Second paragraph of the definition. Column alignments are determined by the position of the header text relative to the dashed line is flush with the header text on the right side but extends beyond it on the left, the column is right-aligned. It is possible to create a bibliography with all the citations, whether or not they appear in the document, by using a wildcard: --- nocite: | @* ... Opening fences are distinguished because they must have attributes: ::: Warning :::::: This is a warning. Anyone using pandoc on untrusted user input should use this option. Exceptions: For odt output, customize the default.opendocument template. The file will be searched for first in the be used with the values top, top-baseline, center and bottom to vertically align the columns. If the value is a map, the string true will be rendered. The fenced Div should be separated by blank lines from preceding and following blocks. Use native pandoc Div blocks for content inside tags. And with the extension: \$ pandoc test/docx/custom-stylereference.docx -f docx+styles -t markdown ::: {custom-style="First Paragraph"} This is some text. You can control the PDF style using variables for ConTeXt, variables for ms. Multiline tables allow header and table rows to span multiple lines of text (but cells that span multiple columns or rows of the table are not supported). * and my second. If no input file is specified (so that input comes from stdin), or if the input format will be assumed to be Markdown. As with fenced code blocks, one can use either attributes in curly braces or a single unbraced word, which will be treated as a class name. Normal citations in footnotes (such as [@foo, p. -p, --preserve-tabs Preserve tabs instead of converting them to spaces. Inline LaTeX is ignored in output formats other than Markdown, LaTeX, Emacs Org mode, and ConTeXt. Inline spans and fenced code blocks with a special kind of attribute will be parsed as raw content with the designated format. If no input-files are specified, input is read from stdin. 2^10^ is 1024. Final newlines are omitted from included partials. or See the [Introduction]. (Conversion happens only if language begins with en or is left empty.) Protect words that should not be converted to title case using this syntax: Spin wave dispersion on the nm scale For a formally published conference paper, use the biblatex entry type inproceedings (which will be mapped to CSL paper-conference). Text.Pandoc.JSON exports to JSONFilter to facilitate writing filters in Haskell. The paths should be separated by : on Linux, UNIX, and macOS systems, and by ; on Windows. This option is set automatically for pdf, epub, epub3, fb2, docx, and odt output. fontcolor sets the CSS color property on the html element. See the section Defaults files for more information on the file format. In Markdown output, code blocks with classes haskell and literate will be rendered using bird tracks, and block quotations will be indented one space, so they will not be treated as Haskell code. The nested list must be indented to line up with the first non-space character after the list marker of the containing list item. While conversions from pandoc's Markdown to all formats aspire to be perfect, conversions from formats more expressive than pandoc's Markdown to all formats aspire to be perfect. attempts to preserve the structural elements of a document, but not formatting details such as margin size. For the most part this should give the same output as raw html, but it makes it easier to write pandoc filters to manipulate groups of inlines. 33]. So, for example, backtick code blocks does not appear as an extension, since it is enabled by default and cannot be disabled. (Using the --sandbox option can protect against this threat, but will also prevent including images in these formats.) If your application uses pandoc as a Haskell library (rather than shelling out to the executable), it is possible to use it in a mode that fully isolates pandoc from your file system, by running the pandoc operations in the PandocPure monad. --shift-heading-level-by=1 may be a good choice for converting Markdown documents that use level-1 headings for sections to HTML, since pandoc uses a level-1 heading to render the document title. Normal citations should be included in square brackets, with semicolons separating distinct items: Blah blah [@doe99; @smith2000; @smith2004]. Pandoc understands an extended and slightly revised version of John Gruber's Markdown syntax. Backslash escapes do not work in verbatim contexts. The default behavior is to determine the best division type via heuristics: unless other conditions apply, section is chosen. Notes are not yet supported for other slide formats, but the notes will not appear on the slides themselves. The attributes may optionally be followed by another string of consecutive colons. --listings Use the listings package for LaTeX code blocks. Even if raw html is disabled, users can include dangerous content in URLs and attributes. If FILE is not found relative to the working directory, it will be sought in the resource path (see --resource-path) and finally in the csl subdirectory of the pandoc user data directory. For more information, see the section on Citations. right n "leftborder": Renders a textual value in a block of width n, aligned to the right, and has no effect on other values. Changes the algorithm

used by auto identifiers to conform to GitHub's method. If no VAL is specified, the key will be given the value true. foo.md foo.md bar.md input-files: - foo.md foo.md bar.md input-files: - foo.md - bar.md The value of input-files: - foo.md foo.md bar.md input-files: - foo.md foo.md foo.md bar.md input-files: - foo.md foo.md foo.md bar.md input-files: - foo.md foo.md bar.md input-files: - foo.md foo.md bar.md input-files: - foo.md foo.md foo.md bar.md input-files: - foo.md foo.md bar.md input-files: - foo.md foo.m verbatim text: that is, special characters do not trigger special formatting, and all spaces and line breaks are preserved. For example: ------ When the header row is omitted, column alignments are determined on the basis of the first line of the table body. If a paragraph is inserted or deleted, track-changes=all produces a span with the class paragraph-insertion/paragraph-deletion before the affected paragraph break. Note: in reveal.js slide shows, if slide level is 2, a two-dimensional layout will be produced, with level-1 headings building horizontally and level-2 headings building vertically. Because is sometimes used inside words and identifiers, pandoc does not interpret a surrounded by alphanumeric characters as an emphasis marker. To see a sample custom reader to have access to reader options (e.g. the tab stop setting), you give your Reader function a second options parameter. \$PATH (executable only) Filters, Lua-filters, and citeproc processing are applied in the order specified on the command line. In HTML output, code blocks with class literatehaskell and bird tracks. This feature allows stylesheets to be customized to give different output for mats. For AsciiDoctor output format (-t asciidoctor) the LaTex delimiters. The Div ends with another line containing a string of at least three consecutive colons. Exception: with a shift of -N, a level-N heading at the beginning of the document replaces the metadata title. If beamer is the output format, specifying either chapter or part will cause top-level headings to become \part{..}, while second-level headings remain as their default type. Either abbreviated forms are accepted. This option can be used repeatedly. Currently this option only affects the Markdown and LaTeX readers. For example: --resource-path=.:test will search the working directory, in that order. RTF, OpenDocument It will be rendered, if possible, using Unicode characters, and will otherwise appear verbatim. The number-lines (or number-lines) class will cause the lines of the code block to be numbered, starting with 1 or the value of the startFrom attribute. one 2. Non-English titles should be in sentence case, and the langid field in biblatex should be set to the relevant language. Enables a MultiMarkdown style title block, with a field spanning multiple lines. To produce a custom reference.docx, first get a copy of the default reference.docx --print-default-data-file reference.docx. The header and table rows must each fit on one line. Before writing your own, have a look at KDE's repository of syntax definitions. These variables change the appearance of PDF slides using beamer. For native output, this option causes metadata to be included; otherwise, metadata is suppressed. If you want to put the bibliography into a variable in your template, one way to do that is to put the bibliography into a variable in your template. ... They are described in the following. There are described in the following. reason for the requirement is that it is all too easy for a > to end up at the beginning of a line by accident (perhaps through line wrapping). The HTML generated by pandoc is not guaranteed to be safe. Then the MathJax JavaScript will render it. The following packages will be used to improve output quality if present, but pandoc does not require them to be present: upquote (for straight quotes in verbatim environments), microtype (for better spacing adjustments), parskip (for better PDF bookmarks), and footnote (to allow footnotes in tables). For example, themes can be used by setting the theme variable: -V theme=moon Or you can specify a custom stylesheet using the --css option. The docx reader, by default, only reads those styles. Strings found in this list will be followed by a nonbreaking space, and the period will not produce sentence-ending space in formats like LaTeX. Elements with the attribute data-external="1" will be left alone; the document. With all HTML slide formats, the --self-contained option can be used to produce a single file that contains all of the data necessary to display the slide show, including linked scripts, stylesheets, images, and videos. Note that the commonmark parser (including commonmark and gfm) is much less vulnerable to pathological performance than the markdown parser, so it is a better choice when processing untrusted input. level headings, or fifth- and sixth-level with book classes) free-standing rather than run-in; requires further formatting to distinguish from \subsubsection (third- or fourth-level headings). Original Markdown allows you to include HTML "blocks": blocks of HTML between balanced tags that are separated from the surrounding text with blank lines, and start and end at the left margin. All reveal.js configuration options are available as variables. The use of this extension is best understood by example. If the code itself contains a row of tildes or backticks, just use a longer row of tildes or backticks at the start and end: CSS are included in the file by default. Field values are transformed to the selected output format. This will be parsed as a KDE syntax highlighting style. Numbered examples can be labeled and referred to elsewhere in the document: (@good) This is a good example. An easy way to do this is to fork the pandoc-templates repository and merge in changes after each pandoc release. (Technically this is not an extension, since standard Markdown, CommonMark, Emacs Org mode, and Textile output, and suppressed in other formats. -L SCRIPT, --lua-filter=SCRIPT Transform the document in a similar fashion as JSON filters (see --filter), but use pandoc's built-in Lua filtering system. Because pandoc's intermediate representation of a document is less expressive than many of the formats it converts between, one should not expect perfect conversions between every format and every other. Whereas Markdown was originally designed with HTML generation in mind, pandoc is designed for multiple output formats. xelatex uses bidi (with the dir variable set). See Extensions below, for a list of extensions and their names. Treat the document as literate Haskell source. Nonbreaking spaces are inserted after certain abbreviations, such as "Mr." This extension can be enabled/disabled for the following formats: input formats markdown, latex, context, rst enabled by default in markdown, latex, context (both input and output) Note: If you are writing Markdown, then the smart extension has the reverse effect: what would have been curly quotes comes out straight. Released under the GPL, version 2 or greater. It, too, may span multiple lines. This can be used to get lettered enumeration from array indices. If variable is an array, the material inside the loop will be evaluated repeatedly, with variable being set to each value of the array in turn, and concatenated. It will appear in TeX output as \\ and in HTML as

--columns=NUMBER Specify length of lines in characters. If the --section-divs option is specified, then each section will be wrapped in a section (or a div, if html4 was specified), and the identifier will be attached to the enclosing (or) tag rather than the heading itself. If you want to use multiple bibliography files, you can supply multiple -bibliography arguments or set bibliography metadata field to YAML array. For pptx, you can use a reference doc in which background images have been set on the relevant layouts. header-include-before-body (may have multiple values) include-before contents specified by -H/--include-in-header (may have multiple values) include-before-body (may have multiple values) include-before contents specified by -H/--include-in-header (may have multiple values) include-before contents specified by -H/--include-in-header (may have multiple values) include-before contents specified by -H/--include-before contents specified by -H/--include-in-header (may have multiple values) include-before contents specified by -H/--include-before contents specified by -H/--include-in-header (may have multiple values) include-before contents specified by -H/--include-in-header (may have multiple values) include-before contents specified by -H/--include-before contents specified by -H/--include-in-header (may have multiple values) include-before contents specified by -H/--include-in-header (may have multiple values) include-before contents specified by -H/--include-before contents specified by -H/--include-in-header (may have multiple values) include-before contents specified by -H/--include-before contents specified by values) include-after contents specified by -A/-include-after-body (may have multiple lines to the same level, align them with the ^ directive in the template. This is usually a better approach when you are targeting LaTeX or PDF. To generate the JSON version of an existing style, use --print-highlight-style. --top-level-division=default|section|chapter|part Treat top-level headings as the given division type in LaTeX, ConTeXt, DocBook, and TEI output. [ref]: "Image title" width=20px height=30px id=myId class="myClass1 myClass1 Natural tables allow more fine-grained global customization but come at a performance penalty compared to extreme tables. In restructured text output, code blocks with class haskell will be rendered using bird tracks. If any line of the markdown source is longer than the column width (see --columns), then the table will take up the full text width and the cell contents will wrap, with the relative cell widths determined by the number of dashes in the line separating the table body. For example: See the [Introduction](#introduction](#introduction]. If no extension corresponding to the writer will be added, so that --template=special looks for special.html for HTML output. fontsize fort size for body text. As the HTML writers pass unknown attributes through, other reveal.js background-color, transition, and transition, and transition, and transition speed. lowercase: (@) My third example will be numbered (3). If this is not found either, sensible defaults will be used. Each Lua filter must contain element-transforming functions indexed by the name of the AST element on which the filter function should be applied. Implies --number-sections. # References The bibliography will be inserted after this heading. To "cut off" the list after item two, you can insert some non-indented content, like an HTML comment, which won't produce visible output in any format: - item one - item two { my code block } You can use the same trick if you want two consecutive lists instead of one big list: 1. If the value of the variable is simple value, it will be rendered verbatim. Sections with class unnumbered will never be numbered, even if --number-sections is specified. Code blocks with the class code will be taken as code cells, and intervening content will be taken as Markdown cells. To write small caps, use the smallcaps of compatibility with other Markdown flavors, CSS is also supported: Small caps This will work in all output formats that support small caps. A link to this section, for example, might look like this: See the section on [heading-identifiers-in-html-latex-and-context]. Remove all footnotes. There is, however, one respect in which pandoc's aims are different from the original aims of Markdown. The bullet must be followed by whitespace. The following tables show the mapping between the command line and defaults file entries. Examples: \$if(foo)\$ \$foo\$ \$endif\$ \$if(foo)\$ bar\$endif\$ keyword elseif may be used to simplify complex nested conditionals: \$if(foo)\$ XXX \$elseif(bar)\$ YYY \$else\$ ZZZ \$endif\$ A for loop begins with endfor (enclosed in matched delimiters) and ends with endfor (and tags is not interpreted as Markdown. In LaTeX, smart means to use the standard TeX ligatures for quotation marks (`` and '' for single quotes) and dashes (-- for en-dash). Note that in a Markdown source document you can also specify cover-image in a YAML metadata block (see EPUB Metadata, below). By default inline links are used. If you use custom templates, you may need to revise them as pandoc changes. A shortcut form can also be used for specifying the language of the code block: ``` {.haskell qsort [] = [] ``` If the fenced_code_attributes extension is disabled, but input contains class attribute(s) for the code block, the first class attribute will be printed after the opening fence as a bare word. Text in the main document language (British English). This extension should not be confused with the link attributes extension. To make a short span of text verbatim, put it inside backticks: What is the difference between `>>=` and ` the default color scheme used by the Python library pygments (though pygments is not actually used to do the highlighting). (How these layouts are used is described in PowerPoint will fit these criteria. It is not recommended that you use deeper nesting of section levels with reveal.js unless you set --slide-level=0 (which lets reveal.js produce a one-dimensional layout and only interprets horizontal rules as slide boundaries). -F PROGRAM, --filter=PROGRAM Specify an executable to be used as a filter transforming the pandoc AST after the input is parsed and before the output is written. The width and height attributes on images are treated specially. So, for example, employee salary will return the value of the salary field of the object that is the value of the salary field of the object that is the value of the salary field. In addition to standard indented code blocks, pandoc supports fenced code blocks. custom-reference.odt in LibreOffice, modify the styles as you wish, and save the file. All messages above DEBUG level will be verten, regardless of verbosity settings (--verbose, --quiet). Variable names must begin with a letter and can contain letters, numbers, _, -, and .. If FILE is a URL, it will be fetched via HTTP. ODT It will be rendered, if possible using MathML. If the heading has the class example, an exampleblock environment will be used; if it has the class alert, an alertblock will be used; otherwise a regular block will be used; otherwise a regul output, styles will be defined in the output file as inheriting from normal text, if the styles are not yet in your reference.docx. There are five ways to do this, using S5, DZSlides, Slidy, s5, slideous, or reveal.js. For example the above example will render to the following. Currently this option only affects the markdown, muse, html, epub, slidy, s5, slideous dzslides, and revealjs writers. (Hence, this option subsumes inline code attributes.) Attributes and link attributes and link attributes and link attributes.) Attributes that occur immediately before a block element. If it is not found there, sensible defaults will be used. When HTML is used as an intermediate format, the output can be styled using --css. But Markdown also allows a "lazy" format: * here is my first list item. --list-output-formats List supported output formats, one per line. three Unlike original Markdown, pandoc allows ordered list items to be marked with uppercase and lowercase letters and roman numerals, in addition to Arabic numerals. (By default, pandoc converts tabs to spaces before parsing its input.) Note that this will only affect tabs in literal code spans and code blocks. How this is rendered depends on the citation style. [my website]: To link to another section of the same document, use the automatically generated identifiers). Section Header This layout is used for what pandoc calls "title slides" i.e. slides which start with a header which is above the slide level in the hierarchy. --bibliography=FILE Set the bibliography field in the document's metadata. To be safe, you should run all HTML generated from untrusted user input through an HTML sanitizer. (In this case, the delimiters may be separated from the formula by whitespace. (Hence, this option subsumes fenced code attributes.) Attributes that occur at the end of a reference link that refer to that definition. subthree Pandoc will start a new list each time a different type of list marker is used. Set the metadata field KEY to the value VAL. This does not apply custom writer is a Lua script that defines a function that specifies how to render each element in a Pandoc AST. --indented-code-classes=CLASSES Specify classes to use for indented code blocks-for example, perl, numberLines or haskell. The material between sep and the endfor is the separator. In writing LaTeX, enabling smart tells pandoc to use the ligatures when possible; if smart is disabled pandoc will use unicode quotation mark and dash characters. Thus, \$20,000 and \$30,000 won't parse as math. Filters, Lua filters, and citeproc processing are applied in the order specified on the command line. not. --dpi=NUMBER Specify the default dpi (dots per inch) value for conversion from pixels to inch/centimeters and vice versa. In Blah blah [see @doe99, pp. SOURCE_DATE_EPOCH should contain an integer unix timestamp (specifying the number of second since midnight UTC January 1, 1970). By default, these writers produce lists that display "all at once." If you want your lists to display incrementally (one item at a time), use the -i option. Note that options and extensions that affect reading and writing of Markdown will also affect markdow to the following rules: A horizontal rule always starts a new slide. Speaker notes in PowerPoint will be available, as usual, in handouts and presenter view. Search defore those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched before those that come later on the command line will be searched be for the command line will be searched b baz:bim:foo:bar. For example: \$item.number\$ \$^\$\$item.description\$ (\$item.price\$) (Available til \$item.sellby\$.) will produce 00123 A fine bottle of 18-year old Oban whiskey. This issue is fully documented here: Encoding issue with the listings package. Use this form when you want to make the citation the subject of a sentence. This extension can be enabled/disabled for the following formats: output formats: output formats: output formats: output formats: output formats and tables inside the document are substituted with cross-referenced item. You can then put the variable \$refs\$ into your template where you want the bibliography to be placed. Makes all absolute URIs into links, even when not surrounded by pointy braces . 02, 2018 or April 02, 2018), yyyy[mm[dd]]](e.g.20180402, 20180402, 20180402, 20180402, 2018). [my website]: Note: In Markdown.pl and most other Markdown.pl and most other Markdown.pl and most other Markdown implementations, reference link definitions cannot occur in nested constructions such as list items or block quotes. List markers may be enclosed in parentheses or followed by a single right-parentheses or period. 33-35 and *passim*; @smith04, chap. In original Markdown, enumerators are decimal numbers followed by a period and a space. --reference-style links, rather than inline links, in writing Markdown or reStructuredText. Here's the Markdown source for a simple slides show, habits.txt: % Habits % John Doe % March 22, 2005 # In the morning ## Getting up - Turn off alarm - Get out of bed ## Breakfast - Eat eggs - Drink coffee # In the evening ## Dinner - Eat spaghetti - Drink wine ----------- ![picture of spaghetti](images/spaghetti.jpg) ## Going to sleep - Get in bed - Count sheep To produce an HTML/JavaScript slide show, simply type pandoc -t FORMAT -s habits.txt -o habits.txt attached to arbitrary elements. lang identifies the main language of the document using IETF language tags (following the BCP 47 standard), such as en or en-GB. That is, example lists always behave as if the four space rule extension is set. -C, --citeproc Process the citations in the file, replacing them with rendered citations and adding a bibliography. --gladtex Enclose TeX math in tags in HTML output. Attributes can be set on links and images: An inline ![image](foo.jpg){#id .class width=30 height=20px} and a reference ![image](ref] with attributes. The tool used to generate the PDF from the intermediate format may be specified using --pdf-engine. -A FILE, --include-afterbody=FILE|URL Include contents of FILE, verbatim, at the end of the document body (before the tag in HTML, or the \end{document}) command in LaTeX). Pandoc will take care of removing the space and moving the note before or after the period, depending on the setting of notes-after-punctuation, as described below in Other relevant metadatates. fields. | The Right Honorable Most Venerable and Righteous Samuel L. If nothing is left after this, use the identifier section. For example, to use the Libertinus fontfamily: libertinus fontfamily: libertinus fontfamily: libertinus font with proportional lowercase (old-style) figures through the libertinus fontfamily: l inline TeX math, and anything between \[and \] to be interpreted as display TeX math. two 3. In @{Foo_bar.baz.}, the key is Foo_bar.baz.}, the key is Foo_bar.baz.}, the key is Foo_bar.baz., including the final period. If no reference ODT is specified on the command line, pandoc will look for a file reference.odt in the user data directory (see --data-dir). By default, sections are not numbered. This option works only with HTML output formats, including html4, html5, html+lhs, html5+lhs, s5, slidy, slideous, dzslides, and revealjs. Second item. With none, pandoc will not wrap lines at all. To put the EPUB contents in the top level, use an empty string. The header may be omitted in multiline tables as well as simple tables: -First row 12.0 Example of a row that spans multiple lines. In TeX output, it will appear as ~. If they follow a space, then they belong to the space. Note that this option does not limit IO operations by filters or in the production of PDF documents. The raw attribute cannot be combined with regular attributes. --section-divs Wrap sections in tags (or tags for html4), and attach identifiers to the enclosing (or) rather than the heading itself. --reference-doc=FILE Use the specified file as a style reference in producing a docx or ODT file. We recommend tracking the changes in the default templates, and modifying your custom templates accordingly. Filters may be written in any language. roff man output uses ASCII by default. This extension can be combined with xrefs_number in which case numbers will appear before the name. If highlighted, with numbered lines. DocBook If the --mathml flag is used, it will be rendered using MathML in an inlineequation or informal equation tag. --syntax-definition=FILE Instructs pandoc to load a KDE XML syntax definition file, which will be used for syntax definition file, which will be numbered (2). It is always loaded into the script's Lua environment. two 1. Include contents of FILE, verbatim, at the end of the header. Parse multimarkdown style subscripts and superscripts, which start with a '~' or '^' character, respectively, and include the alphanumeric sequence that follows. -o FILE, --output=FILE Write output to FILE instead of stdout. This option may be used with -o/--output to redirect output to a file, but -o/--output must come before --print-highlight-style on the command line. haddock (Haddock markup) html3 (HTML, i.e. HTML5/XHTML polyglot markup) html3 (HTML, i.e. HTML5/XHTML polyglot markup) html4 (XHTML 1.0 Transitional) icml (InDesign ICML) ipynb (Jupyter notebook) jats archiving (JATS XML, Archiving and Interchange Tag Set) jats articleauthoring (JATS XML, Article Authoring Tag Set) jats publishing (JATS XML, Journal Publishing Tag Set) jats (Jira/Confluence wiki markup) json (JSON version of native AST) latex (LaTeX) man (roff man) markdown (Pandoc's Markdown) markdown mmd (MultiMarkdown) markdown phpextra (PHP Markdown Extra) markdown strict (original unextended Markdown) markua (Markua) mediawiki (MediaWiki markup) ms (roff ms) muse (Muse), native (native Haskell), odt (OpenOffice text document) opml (OPML) opendocument) o show) rst (reStructuredText) rtf (Rich Text Format) texinfo) textile (Slide show) dzslides (DZSlides HTML5 + JavaScript slide show) slidy (Slidy HTML and JavaScript slide show) tei (TEI Simple) xwiki (XWiki markup) zimwiki (ZimWiki markup) the path of a custom Lua writer, see Custom readers and writers below Note that odt, docx, epub, and pdf output will not be directed to stdout unless forced with -o -. Causes all newlines within a paragraph to be interpreted as hard line breaks instead of spaces. If a slide level is not specified explicitly, the slide level will be set automatically based on the contents of the document; see Structuring the slide show. This option may be used with -o/--output to redirect output to a file, but -o/--output to redirect output to 141 for 1.41:1, 54 for 5:4, 32 for 3:2) `beameroption add extra beamer option with \setbeameroption {} institute author affiliations: can be a list when there are multiple authors logo logo image for slides navigation symbols; other valid values are frame, vertical, and horizontal) sectiontitles enables "title pages" for new sections (default is true) theme, colortheme, innertheme, innertheme, outertheme beamer themes themeoptions optional, but pipes are required between all columns. would produce a docx file with "Get out" styled with character style Emphatically. The first number is added to the section number for top-level headings, the second for second-level headings, and so on. To print-default-data-file=templates/styles.html. The syntax for the attributes is the same as that used in header_attributes. All options for document conversion, including input and output files, can be set using a defaults file. If none is provided using this option (or the css or stylesheet metadata fields), pandoc will include some basic styling contained in its epub.css data file. This extension can be enabled/disabled for the following formats (in addition to markdown): input formats latex, textile, html (environments, \ref, and \eqref only), ipynb output formats textile, commonmark Note: as applied to ipynb, raw html and raw tex affect not only raw TeX in markdown cells, but data with mime type text/html in output cells. This will work for most purposes, especially alongside a reference.docx file. This is useful for preventing duplicate identifiers when generating fragments to be included in other pages. If the > character is followed by an optional space, that space will be considered part of the block quote marker and not part of the indentation of the contents. three Pandoc supports task lists, using the syntax of GitHub-Flavored Markdown. Thus, for example, This ~~is deleted text.~~ Superscripted text by ^ characters; subscripted text by ~ characters; subscrip match the number in the opening fence. This option may be used with -o/--output to a file, but -o/--output to a file, but -o/--output to a file, but -o/--output must come before --print-default-data-file on the command line. - It can contain Markdown - like this list ::: To show the notes window in reveal.js, press s while viewing the presentation. Note that currently only Firefox and Safari (and select e-book readers) natively support MathML. In some cases you may need to put a citation inside a regular footnote. If you leave space before the definition will be treated as a paragraph. Metadata will be treated as a paragraph. commenting out some lines in the default template.) These rules are designed to support many different styles of slide show. The contents of the reference docx are ignored, but its stylesheets and document properties (including margins, page size, header, and footer) are used in the new docx, reject ignores them, --no-check-certificate Disable the certificate verification to allow access to unsecure HTTP resources (for example when the certificate is no longer valid or self signed). These vary depending on the output format, and include the following: body body of document date-meta the date variable converted to ISO 8601 YYYY-MM-DD, included in all HTML based formats (dzslides, epub, html, html4, html5, revealjs, s5, slideous, slidy). This will cause the author's name to be rendered, followed by the bibliographical details. For example, --wrap=preserve will prevent tabs from being turned to spaces. Although pandoc itself will not create or modify any files other than those you explicitly ask it create (with the exception of temporary files used in producing PDFs), a filter or custom writer could in principle do anything on your file system. D. To set an image for a particular reveal, is or pptx slide, add {background-image="/path/to/image"} to the first slidelevel heading on the slide (which may even be empty). To include the built-in citeproc filter, use either citeproc or {type: citeproc or {type: citeproc}. To produce a PDF slide show using beamer, type pandoc -t beamer habits.txt -o habits. need to enclose text in literal \$ characters, backslash-escape them and they won't be treated as math delimiters. Here are some examples: [my label 1]: /foo/bar.html "My title, optional" [my label 2]: /foo [my label 3]: (The free software foundation) [my label 4]: /bar#special 'A title in single quotes' The URL may optionally be surrounded by angle brackets: [my label 5]: <> The title may go on the next line: [my label 3]: "The free software foundation" Note that link labels are not case sensitive. For elements are placed in a surrounding Div or Span element with a data-pos attribute. ::: ::: {.column width="60%"} contents... The first line of output contains the name of the output file was specified. So, for example will be numbered (1). The default is to render TeX math as far as possible using Unicode characters. In this case pandoc will fetch the content using HTTP: pandoc -f html -t markdown It is possible to supply a custom User-Agent string or other header when requesting a document from a URL: pandoc -f html -t markdown --request-header User-Agent string or other header User-Agent string or othe allow the contents of a file to be included in the output. --biblatex Use biblatex for citations in LaTeX output. references are provided, both will be used. fontsize sets the base CSS font-size, which you'd usually set to e.g. 20px, but it also accepts pt (12pt = 16px in most browsers). There are two kinds of headings: Setext and ATX. The use of xelatex or lualatex as the PDF engine requires fontspec. --html-q-tags Use tags for quotes in HTML. The author and time of change is included. In LaTeX input, text in code environments will be parsed as Haskell code. These elements are not influenced by CSL styles, but all information on the item is included in tags. Note that venue is for the event's venue, unlike location; do not use the latter for an unpublished conference paper. two Pandoc also pays attention to the type of list marker used, and to the starting number, and both of these are preserved where possible in the output format. Citations and references can be formatted using any style supported by the Citation Style Language, listed in the Zotero Style Repository. For example, with --shift-heading-level-by=-1, level 2 headings become level 3 headings become level 2 headings. ::: :::: {custom-style="My Block Style"} > Here is a styled paragraph that inherits from Block Text. rest: Returns all but the first value of an array, if applied to a non-empty array; otherwise returns the original value. (If the input format is Markdown or a Markdown or a Markdown variant, then the same variant will be used to parse the metadata file; if it is a non-Markdown format, pandoc's default Markdown extensions will be used.) This option can be used repeatedly to include multiple metadata files; values in files specified later on the command line will be preferred over those specified later on the command line will be used.) This option can be used repeatedly to include multiple metadata files; values in files specified later on the command line will be preferred over those specified in earlier files. with a fence containing at least three consecutive colons plus some attributes. To see a documented example which you can modify according to your needs: pandoc --print-default-data-file sample.lua Note that custom writers have no default template. deoxyribose nucleic acid' title-short: Molecular structure of nucleic acids container-title: Nature volume: 171 issue: 4356 page: 737-738 DOI: 10.1038/171737a0 URL: language: en-GB ... --bash-completion script. This option can be repeated to embed multiple fonts. The if section is used if variable has a non-empty value. otherwise the else section is used (if present). -c URL, --css=URL Link to a CSS style sheet. -T STRING, --title-prefix=STRING specify STRING as a prefix at the beginning of the title that appears in the HTML header (but not in the title as it appears at the beginning of the title that appears at the beginning of the title that appears in the HTML header (but not in the title as it appears at the beginning of the title that appears at the beginning of the title that appears at the beginning of the title as it appears at the beginning of the title that appears at the beginning of the title that appears at the beginning of the title as it appears at the beginning of the title as it appears at the beginning of the title that appears at the beginning of the title as it appears at the beginning of the title that appears at the beginnig original Markdown. In some output formats, this will mean greater spacing between term/definition pairs. (This is because ghc treats '#' characters in column 1 as introducing line numbers.) In restructured text input, "bird track" sections will be parsed as the empty string. In HTML and XML output, it will appear as a literal unicode nonbreaking space character (note that it will thus actually look "invisible" in the generated HTML source; you can still use the --ascii command-line option to make it appear as an explicit entity). Example: ::::: {#special .sidebar} Here is a paragraph. This option is intended for use by developers in diagnosing performance issues. In @Foo bar.baz., the key is Foo bar.baz because the final period is not internal punctuation, so it is not included in the key. If the value of the associated variable is not an array or a map, a single iteration will be performed on its value. It is sensitive to the locator terms defined in the CSL locale files. institute author affiliations: can be a list when there are multiple authors reveal.js documents (defaults to s1/defaults to s2/default) slidy-url base URL for S1/defaults to s2/default) slidy-url base URL for S1/defaults to s1/defaults reveal.js slide shows. A few inline styles are defined in addition; these are essential for correct formatting of pandoc --print-default-data-file epub.css.) To use a different CSS file, just use the --css command line option. as ellipses. Users can also run custom pandoc filters to modify the intermediate AST. Except where noted, these differences can be suppressed by using the markdown. If FILE is not found relative to the working directory, it will be sought in the resource-path is not specified, the default resource path is the working directory. --epub-embed-font=FILE Embed the specified font in the EPUB. margin-left, margin-l with some extensions.2 Term 1 : Definition 1 Term 2 with *inline markup* : Definition 2 { some code, part of Definition 2 } Third paragraph of definition 2. Filters are run in the order specified. -i, --incremental Make list items in slide shows display incrementally (one by one). --markdown-headings=setext|atx Specify whether to use ATX-style (#-locator term is used, "page" is assumed. See also Extensions above, for extensions that work also on other formats. linestretch sets the CSS line-height property on the html element, which is preferred to be unitless. This is the default in odt output. Note that this only works for images; the other media elements have no native representation in pandoc's AST and requires the use of raw HTML. Second row 5.0 Here's another one. If you do write an explicit note that contains a citations will not. backgroundcolor sets the CSS background-color property on the html element. --: Here's a multiline table without a header. The following Markdown syntax extensions are not enabled by default in pandoc, but may be enabled by adding +EXTENSION to the format name, where EXTENSION is the name of the extension. The totalwidth attribute limits the width of the columns to the given value. This option is not for use with the --citeproc option or with PDF output. Headings above this level in the hierarchy are used to divide the slide show into sections; headings below this level create subheads within a slide. document-css Enables inclusion of most of the CSS in the styles.html). When citations is enabled in docx, citations inserted by Zotero or Mendeley or EndNote plugins will be parsed as native pandoc citations. The remaining lines contain the command-line arguments, one per line, in the order they appear. Borders are strings inside double quotes; literal " and \ characters must be backslash-escaped. Disabled by default. (This option only has an effect if the smart extension is enabled for the input format used.) --ascii Use only ASCII characters in output. Selects the pandoc ::: wrapper > - a > - list in a quote > ::: You can add "pauses" within a slide by including a paragraph containing three dots, separated by spaces: # Slide with a pause content before the pause . (Note that no escaping is done; the assumption is that the calling program will escape the strings appropriately for the output format.) If the values will be concatenated. When creating a Jupyter notebook, pandoc will try to infer the notebook structure. If you wish the bibliography to have a section heading, you can set reference-section-title in the metadata, or put the heading at the beginning of the div with id refs (if you are using it) or at the end of your document: last paragraph... For a survey of the literature, see @baz [chap. Causes anything between \\(and \\) to be interpreted as display TeX math. --ipynboutput=all|none|best Determines how ipynb output cells are treated. The following extensions are described in more detail in their respective sections of Pandoc's AST to be parsed as raw HTML. To put material in side by side columns, you can use a native div stylesheets customized in this way will not be usable by other CSL implementations. In reveal.js's overview mode, the parallaxBackgroundImage will show up only on the first slide. Attributes can be attached to verbatim text, just as with fenced code blocks: ``{.haskell} To underline text, use the underline class: [Underline] Or, without the bracketed spans extension (but with native spans): Underline This will work in all output formats that support underline. (There cannot be space between the two unless the the two unl space) a link title either in quotes or in parentheses. If the original value was an array, the key will be the array index, starting with 1. first: Returns the first value of an array, if applied to a non-empty array; otherwise returns the first value of an array. emphasized *, and *neither is this*. The extensions tex math dollars, tex math dollars, tex math double backslash, and tex math double backslash are described in the section about Pandoc's Markdown. pandoc -s --gladtex input.md -o myfile.htex gladtex -d image dir myfile.htex # produces myfile.h command-line arguments to stdout, then exit. This is text with an *emphasized* text style. It defaults to top in columns. The division into lines will be formatted as Markdown. The ICC profiles and output intent may be specified using the variables pdfaiccprofile and pdfaintent. See also ConTeXt PDFA for more details. This extension can be enabled/disabled for the following formats: output formats odt, opendocument When converting from docx, read all docx styles) and spans (for character styles example, the document will contain a citation for item3 only, but the bibliography will contain entries for item1, item2, and item3. --print-default-data-file=FILE Print a system default data file. Use the bibliography will contain entries for item1, item2, and item3. --print-default-data-file=FILE Print a system default data file. reference.docx in the user data directory (see --data-dir). Thus, to convert hello.html from HTML to Markdown to LaTeX, you could type: pandoc -f html -t markdown hello.html Supported input and output formats are listed below under Options (see -f for input formats and -t for output formats). Spaces are converted to dashes (-), uppercase characters to lowercase characters, and punctuation characters other than - and are removed. alpha: Converts textual values that can be read as an integer into lowercase alphabetic characters a..z (mod 26). --standalone --template letter --variable kev=val \ --variable kev2 variables: key: val key2: true --eol nl --dpi 300 --wrap 60 --columns 72 --table-of-contents --toc --toc-depth 3 --strip-comments --no-highlight --highlight --hi inc.tex --include-after-body inc.tex include-after-body: - inc.tex --resource-path .: ["User-Agent", "Mozilla/5.0"] --reference-location block reference-location: block --markdown-check-certificate: true --self-contained --html-q-tags --ascii --reference-location: block reference-location: block --markdown-check-certificate: true --self-contained --html-q-tags --ascii --reference-location: block reference-location: block --markdown-check-certificate: true --self-contained --html-q-tags --ascii --reference-location: block reference-location: block --markdown-check-certificate: true --self-contained --html-q-tags --ascii --reference-location: block reference-location: block --markdown-check-certificate: true --self-contained --html-q-tags --ascii --reference-location: block reference-location: block --markdown-check-certificate: true --self-contained --html-q-tags --ascii --reference-location: block --markdown-check-certificate: true --self-contained --html-q-tags headings atx --top-level-division chapter top-level-division: chapter --number-offset=1,4 --listings --incremental --slide-level 2 --section-divs --email-obfuscation: references --id-prefix Ch1 --title-prefix Ch1 --title-p reference-doc my.docx --epub-cover-image cover.jpg epub-cover-image: cover.jpg --epub-metadata meta.xml --epub-embed-font special.otf - headline.otf --epub-chapter-level 2 --epub-cover-image cover.jpg epub-cover-image cover.jpg epub-cover-image cover.jpg epub-cover-image cover.jpg --epub-metadata meta.xml --epub-embed-font special.otf - headline.otf --epub-cover-image cover.jpg epub-cover-image c escape' pdf-engine-opt: '-shell-escape' --citeproc --bibliography logic.bib metadata: bibliography: logic.bib --csl ieee.csl --citation-abbreviations ab.json metadata: citation-abbreviations ab.json metadata: bibliography: logic.bib --csl ieee.csl --citation-abbreviations ab.json metadata: bibliography: logic.bib --csl ieee.csl --citation-abbreviations ab.json metadata: citation-abbreviations ab.json metadata: citation-abbreviations ab.json metadata: bibliography: logic.bib metadata: bibliography: logic.bib --csl ieee.csl --citation-abbreviations ab.json metadata: citation-abbreviations ab.json metadata: citation-abbreviations ab.json metadata: citation-abbreviations ab.json metadata: bibliography: logic.bib --csl ieee.csl --citation-abbreviations ab.json metadata: citation-abbreviations ab.json metadata: rendered inside code environments. --pdf-engine=PROGRAM Use the specified engine when producing PDF output. To get uppercase letters, chain with uppercase l enabled, abbreviation keys are simply skipped (as opposed to being parsed as paragraphs). toc include table of contents (can also be set using --toc/--table-of-contents) whitespace spacing between paragraphs). toc include table of contents (can also be set using --toc/--table-of-contents) whitespace spacing between paragraphs, e.g. none, small (using setupwhitespace) includesource include all source documents as file attachments in the PDF file Pandoc uses these variables when creating a PDF with wkhtmltopdf. When calling the partial, the full name including file extension can also be used: \${ styles.html() } (If a partial is not found in the template and the template and the template may optionally be applied to variables using a colon: \${ date:fancy() } \${ articles:bibentry() } If articles is an array, this will iterate over its values, applying the partial bibentry() to each one. ::: Danger This is a warning within a warning.
